

## InSoFast Panels on the Basement Floor are Warm and Comfortable

- The cold basement floor is a thing of the past. Using InSoFast on the floor makes the basement feel like the upstairs.
- Worries about mold and mildew for stored items is eliminated - moisture load for a dehumidifier can cut by up to 90% because the cold damp concrete floor is completely isolated.
- InSoFast can be detailed for radon mitigation in the walls and the floor creating a healthier living environment.

**It's not what it is that is important....It's what it does for your family that counts.**

## Simple Installation Process

The InSoFast panels are ideally suited for concrete floors. The panels are easy to install with the tongue and groove edges. The typical installation method is without adhesive with the subfloor screwed to the built in studs. This allows the floor system to float over irregularities and it also provides a comfortable walking surface.

## Safety in the Basement

The InSoFast panels are a safe material in the often times damp environment of the basement. The EPS closed cell foam and plastic studs of the panel are rot and mold resistant.

## Moisture Control

InSoFast panels create a barrier that isolates the damp concrete floor from the interior living space. It is also a buffer during small flood events, keeping the subfloor and carpet dry 2" above the concrete floor.

## Unlimited Finishes

Virtually any type of flooring can be installed over top of the subfloor:

- Carpet
- Vinyl
- Luxury Vinyl Tile
- Tile
- Laminate
- 3/4" T&G Wood Flooring

Please consult the finish manufacturer's installation instructions.
